Jamhuriya University of Science & Technology

Faculty of Computer & IT

Course Title: PHP & MySQL

Due date: October 06, 2026

1) Write PHP code that:

    1) declares an array of one dimension, initialize it to the following values:

        (5, -7, 12, 10, -7, 11, -6, 12, 1, -7, 2, 9)

    2) Print all elements of the array

    3) Calculate and print total of all elements

    4) Calculate and print total of even elements

    5) Calculate and print total of odd elements

    6) Find minimum element and its positions and

    7) Find maximum element and its positions

2) Write PHP program that declares an **associative array of two dimensions** where row names are **Light, Normal, and Dark**, column names are **Red, Green, Blue.** Array elements are shown in the below table, then print array elements as shown in the table.

	Red	Green	Blue
Light	Light Red	Light Green	Light Blue
Normal	Normal Red	Normal Green	Normal Blue
Dark	Dark Red	Dark Green	Dark Blue

3) Write PHP program that declares an array of two dimensions (square array, where number of rows is equal number of columns). Use the table shown to format the output.

1) Declare the array and initialize it with the following values:
   Row1 {2, -6, 8}
   Row2 {-6, 1, 6}
   Row3 {7, 8, -6}
2) Print all elements of the array
3) Calculate and print total of odd elements
4) Calculate and print total of even elements
5) Calculate and print total of each row
6) Calculate and print total of each column
7) Calculate and print total of each diagonal
8) Calculate and print and total of all elements
9) Find minimum element and its positions
10) Find maximum element and its positions

Total odd elements = 8				
Total even elements = 6				
-3	3	3	8	16
4	2	-6	8	4
1	-6	1	6	1
9	7	8	-6	9
16	3	3	8	-3
Total all elements = 14				
Min element is: -6 in 3 positions: [0,1,], [1,0,], and [2,2,],				
Maximum element is: 8 in 2 positions: [0,2,], and [2,1,],				

4) Write PHP program that declares an **associative array of two dimensions** where row names are **CA202, CA207, and CA202**, column names are **Name, Phone, Address.** Array elements are shown in the below table, then print array elements as shown in the table.

	Name	Phone	Address
CA221	Mohamed Ahmed Ali	0648440403	Laba Dhagax, Wardhiigley
CA223	Ahmed Abdi Jama	0647223201	Taleex, Hodan
CA221	Amina Nur Adan	0646990276	Macmacaanka, Dharkeynley

5) Write PHP program that declares an array of student transcript based on semesters (1,2,3,4…) as shown in the below table, then print array elements as shown in the table.

Semester	Course	CW1	MidTerm	CW2	Final	Total	Status
Semester 1	subject1	9	26	10	40	85	Pass
	subject2	9	26	10	40	85	Pass
	subject3	9	26	10	40	85	Pass
Semester 2	subject1	9	26	10	0	45	Fail
	subject2	9	26	10	40	85	Pass
	subject3	9	26	10	40	85	Pass

END
